

12 Adult human haemoglobin typically consists of two α chains and two β chains.

Approximately 5% of humans have one amino acid in the β chain that has been changed. This change affects the structure and stability of haemoglobin.

Which levels of protein structure could be affected in the haemoglobin of the humans with the changed amino acid?

- A** primary only
- B** primary and quaternary only
- C** secondary, tertiary and quaternary only
- D** primary, secondary, tertiary and quaternary
