

- 20 Some agar was coloured pink using a pH indicator. The pink agar was then used to make three agar cubes with different dimensions.

The cubes were placed in a beaker and covered with 0.1 mol dm^{-3} hydrochloric acid. The temperature of the experiment was standardised at 20°C .

Hydrochloric acid diffused into the agar cubes causing the cubes to become colourless.

What is the surface area to volume ratio of the agar cube that became colourless in the **least** amount of time?

- A** 0.33:1 **B** 0.83:1 **C** 1.2:1 **D** 3.0:1
