

Question	Marking Guidance	Mark	Comments
09.1	1. Micelles contain bile salts and fatty acids/monoglycerides; 2. Make fatty acids/monoglycerides (more) soluble (in water) OR Bring/release/carry fatty acids/monoglycerides to cell/lining (of the iluem) OR Maintain high(er) concentration of fatty acids/monoglycerides to cell/lining (of the ileum); 3. Fatty acids/monoglycerides absorbed by <u>diffusion</u> ; 4. Triglycerides (re)formed (in cells); 5. Vesicles move to cell membrane;	5	1. Ignore other correct components of micelles 2. Accept lipid/fat for fatty acid/monoglyceride 3. Reject if absorbed by facilitated diffusion 3. Ignore if micelles themselves are being absorbed 4. Accept chylomicrons form 5. Accept exocytosis for 'vesicles move'
09.2	1. Structure is deternmined by (relative) position of amino acid/R group/interactions; 2. Primary structure is sequence/order of amino acids; 3. Secondary structure formed by hydrogen bonding (between amino acids); 4. Tertiary structure formed by interactions (between R groups); 5. Creates active site in enzymes OR Creates complementary/specific shapes in antibodies/carrier proteins/receptor (molecules); 6. Quaternary structure contains >1 polypeptide chain OR Quaternary structure formed by interactions/bonds between polypeptides;	5 max	3. Accept alpha helix/ β -pleated sheet for 'secondary structure' 1., 4. and 6. Accept for 'intereactions', hydrogen bonds/disulfide bridges/ionic bonds/hydrophobic-hydrophilic interactions 6. Accept prosthetic (group)
