

10(a)	A – chloroplast ; B – vacuole ; C – cell wall ; A cell surface membrane	3
10(b)	any four from: 1 abscisic acid binds to receptors on cell surface membrane (of guard cell) ; 2 proton pumps are inhibited / AW ; 3 stimulates Ca^{2+} uptake / opens Ca^{2+} channels ; 4 Ca^{2+} acts as second messenger ; 5 K^{+} diffuses out of the (guard) cell ; 6 water potential of (guard) cell increases ; 7 water leaves (guard) cell, by osmosis / down water potential gradient ; 8 (guard) cell becomes flaccid / cell volume decreases (so stoma closes) ;	4
