

Question	Marking Guidance	Mark	Comments
05.1	- Facilitated diffusion involves channel or carrier proteins whereas active transport only involves carrier proteins; - Facilitated diffusion does not use ATP / is passive whereas active transport uses ATP; - Facilitated diffusion takes place down a concentration gradient whereas active transport can occur against a concentration gradient;	3	Since 'contrast', both sides of the differences needed
05.2	3.3:1;	2	Correct answer = 2 marks If incorrect, allow 1 mark for 470–360/60 for rate in second hour
05.3	- Group A – initial uptake slower because by diffusion (only); - Group A – levels off because same concentrations inside cells and outside cells / reached equilibrium; - Group B – uptake faster because by diffusion plus active transport; - Group B fails to level off because uptake against gradient/no equilibrium to be reached; - Group B – rate slows because few/fewer chloride ions in external solution/respiratory substrate used up;	4 max
