

- 79** In a mammal, an impulse travels along a neurone of length 45 cm in 3.0×10^{-3} seconds.

Transmission across the synapse to another neurone takes 4.0×10^{-10} seconds. The synapse has a width of 20 nm.

Which row correctly compares the speed of transmission across the synapse with the speed of transmission along the neurone, and what is the method of transmission across the synapse?

	<i>speed of transmission across the synapse compared to speed of transmission along the neurone</i>	<i>method of transmission across the synapse</i>
A	300 times faster	chemical, by active transport
B	300 times faster	chemical, by diffusion
C	300 times faster	electrical impulse
D	3 times slower	chemical, by active transport
E	3 times slower	chemical, by diffusion
F	3 times slower	electrical impulse
G	300 times slower	chemical, by diffusion
H	300 times slower	electrical impulse
