

2 Which statement about a light microscope is correct?

- A As the distance to see two points as separate points decreases, the resolution also decreases.
- B A bacterium $0.2\text{ }\mu\text{m}$ in diameter will **not** be visible if the resolution is 220 nm.
- C Two membranes that are less than 300 nm apart will be visible as two separate membranes if the wavelength of light is 600 nm.
- D The resolution will improve with visible light of a longer wavelength, such as red light.
