

Question	Marking guidance	Mark	Comments
04.1	6 (g dm ⁻³);	1	
04.2	Correct answer of (–)0.14;; 1 mark for correct difference in concentration (5) divided by 35 / (69 – 64) ÷ 35 / 1 ÷ 7	2	Ignore +/- sign Ignore additional d.p. Accept 0.31(4) for 1 mark if female data used
04.3	1. Protein content decreases with age <u>and</u> decreases more in females; 2. Difference (between sexes) only significant at 95 years because SDs do not overlap; OR Differences not significant because 2 x SD would overlap;	2	
04.4	1. Produce known concentrations of <u>protein</u> ; 2. Measure absorbance of each concentration OR Measure each concentration with colorimeter; 3. Plot a graph of absorbance on y-axis against concentration (on x-axis) <u>and</u> draw curve; 4. Use absorbance of sample to find protein concentration from curve;	3 max	1. Idea of known concentrations required. Accept % transmission / absorption for absorbance
04.5	(Lower plasma protein concentration suggests) fewer antibodies;	1	Ignore ref. to other proteins. Reject answers which refer to white blood cells as proteins.
