

- 17** Equal sized potato pieces were placed into a test-tube and covered with a sucrose solution. The test-tube was left for 30 minutes. All other variables were standardised.

After 30 minutes, the potato piece had not changed in size.

What can be concluded from this result?

- A** The concentration of sucrose is the same in the potato and in the solution and there is no more movement of water into or out of the potato.
- B** The concentration of sucrose is the same in the potato and in the solution and there is no net movement of water into the potato.
- C** The water potential is the same in the potato and in the sucrose solution and there is no more movement of water into or out of the potato.
- D** The water potential is the same in the potato and in the sucrose solution and there is no net movement of water into or out of the potato.
