

- 14** The Michaelis–Menten constant, K_m , is the substrate concentration at which an enzyme works at half its maximum rate.

What is correct when the K_m value is low?

- A** The enzyme has a low affinity for the substrate and the quicker the reaction will proceed to its maximum rate.
- B** The enzyme has a low affinity for the substrate and the slower the reaction will proceed to its maximum rate.
- C** The enzyme has a high affinity for the substrate and the quicker the reaction will proceed to its maximum rate.
- D** The enzyme has a high affinity for the substrate and the slower the reaction will proceed to its maximum rate.
