

- 18 The diagram shows how an artificial partially permeable membrane was used to separate a 5% sodium chloride solution and a 10% sodium chloride solution in a beaker. The two sides of the beaker were labelled R and S.

Which row correctly describes and explains what will happen in the half of the beaker labelled S?

	description of S	explanation
A	volume of solution increases	net movement of water from a higher water potential to a lower water potential
B	volume of solution increases	net movement of water from a lower water potential to a higher water potential
C	volume of solution decreases	net movement of water from a higher water potential to a lower water potential
D	volume of solution decreases	net movement of water from a lower water potential to a higher water potential
