

**8** Diastase is an enzyme that breaks down starch into maltose.

A sample of starch is treated with boiled diastase and left for 15 minutes.

Samples of the mixture are then tested with iodine solution and with Benedict's solution.

What is the correct result?

|          | iodine solution | Benedict's solution |
|----------|-----------------|---------------------|
| <b>A</b> | blue-black      | blue                |
| <b>B</b> | blue-black      | red                 |
| <b>C</b> | brown           | blue                |
| <b>D</b> | brown           | red                 |
