

- 38** Muscle cells have cell surface receptors for the neurotransmitter, ACh. These receptors allow the muscle to respond to a nerve impulse.

In the condition myasthenia gravis, the helper T cells stimulate a clone of B cells to become plasma cells and secrete antibodies that bind to and block these ACh receptors. The muscles cannot be stimulated and begin to break down.

A short-term treatment for myasthenia gravis is to inject monoclonal antibodies into the blood.

What is the target of these monoclonal antibodies?

- A** antibodies that bind to ACh receptors
- B** muscle cell surface ACh receptors
- C** plasma cells secreting anti-ACh receptor antibodies
- D** the stimulating neurotransmitter ACh
