

Question	Marking guidance	Mark	Comments
09.1	1. Water lost from leaf because of transpiration / evaporation of water (molecules) / diffusion from mesophyll / leaf cells; OR Transpiration / evaporation / diffusion of water (molecules) through stomata / from leaves; 2. Lowers water potential of mesophyll / leaf cells; 3. Water pulled up xylem (creating tension); 4. Water molecules cohere / 'stick' together by hydrogen bonds; 5. (forming continuous) water column; 6. Adhesion of water (molecules) to walls of xylem;	5 max	2. Accept Ψ or WP
09.2	1. The DNA strands separate by breaking the H bonds; OR H bonds broken between (complementary) (DNA) bases; 2. (Only) one of the strands/template strand is used (to make mRNA/is transcribed); 3. (Complementary) base pairing so A→U, T→A, C→G, G→C; 4. (RNA) <u>nucleotides</u> joined by RNA polymerase; 5. pre-mRNA formed; 6. Splicing / introns removed to form mRNA;	5 max	1. Ignore 'hydrolysis' of bonds 1. Accept DNA "unzips" by breaking the H bonds 6. Accept 'non-coding' sections for introns
