

- 15** The enzyme β -galactosidase can catalyse the hydrolysis of four substrates, **A**, **B**, **C** and **D**, with similar structures.

Each substrate has a different K_m value.

For which substrate does β -galactosidase have the **lowest** affinity?

A $K_m = 4 \times 10^{-3} \text{ mol dm}^{-3}$

B $K_m = 1 \times 10^{-3} \text{ mol dm}^{-3}$

C $K_m = 2 \times 10^{-4} \text{ mol dm}^{-3}$

D $K_m = 1 \times 10^{-4} \text{ mol dm}^{-3}$
