

13 Which row correctly describes haemoglobin?

A	four polypeptide chains, each containing a haem group	iron ions can associate with oxygen, forming oxyhaemoglobin	in each chain, hydrophobic R-groups of amino acids point towards the centre of the molecule	at 50% saturation, two oxygen molecules are transported by the molecule
B	polypeptide chains interact to produce a globular chain	each chain contains a haem group of amino acids surrounding an iron ion	consists of two identical alpha chains and two identical beta chains	each chain can transport an oxygen molecule
C	polypeptide chains interact to produce an almost spherical molecule	an iron ion is present within each haem group	quaternary structure has two alpha chains and two beta chains	each molecule can transport a total of four oxygen atoms
D	polypeptide chains produce a loose helical shape, which folds to form a spherical molecule	iron ions in the molecule can bind reversibly with oxygen	in each chain, hydrophobic R-groups of amino acids surround the iron ion	each molecule can transport a total of eight oxygen atoms
