

- 12** A student was provided with two test-tubes, one containing  $10\text{cm}^3$  of solution P and one containing  $10\text{cm}^3$  of solution Q. When these solutions were mixed together and left for 24 hours, the concentration of P decreased but the concentration of Q remained the same.

The student wrote the following conclusions.

- 1 P may break down over time.
- 2 Q may be a biological catalyst.
- 3 P may be the substrate for Q.

Which conclusions could be supported by the information?

- A** 1, 2 and 3      **B** 1 and 2 only      **C** 1 only      **D** 2 and 3 only
