

71 The effect of pH on the breakdown of starch by pancreatic amylase was investigated.

Starch and pancreatic amylase solution were mixed in test tubes, each at a different pH. The percentage of starch remaining after 5 minutes was recorded on the graph.

All other variables were kept constant.

Using these results, which of the following conclusions could be correct?

- 1** During the 5 minutes, there are more enzyme–product complexes formed at pH 4.5 than at pH 6.
 - 2** The shape of the enzyme is different at pH 5 compared to the shape at pH 7.
 - 3** The optimum pH for this enzyme is approximately pH 7 under the conditions of this experiment.
- A** none of them
- B** 1 only
- C** 2 only
- D** 3 only
- E** 1 and 2 only
- F** 1 and 3 only
- G** 2 and 3 only
- H** 1, 2 and 3
