

38 Immune response to a vaccination against a virus can be assessed by making three measurements:

- 1 the concentration of anti-virus antibody in the blood
- 2 the time taken to increase the antibody concentration significantly after a booster vaccination
- 3 the number of virus-specific lymphocytes per cm^3 blood.

What describes the immunity of an individual when the values of 1, 2 and 3 are all low ten years after vaccination?

- A** active immunity due to the presence of memory cells
- B** low immunity due to the absence of antibodies
- C** low immunity due to the absence of memory cells
- D** passive immunity due to the presence of antibodies
