Name the process by which prokaryotic cells divide.

[1 mark]

0 4 . 4

Some prokaryotic cells can divide every 30 minutes. A liquid culture contained a starting population of 1.35×10^4 cells.

Assuming each cell divides every 30 minutes, calculate how many cells there will be after 3 hours. Assume no cells die during this time.

[2 marks]

Answer = _____

7
