

Question Number	Answer	Additional guidance	Mark
1(a)(i)	An answer that includes the following points: • correct phloem position (1) • correct sclerenchyma position (1) • correct xylem position (1)	Example:  The micrograph shows a cross-section of plant tissue. Handwritten labels with lines pointing to specific structures are present: 'Sclerenchyma' points to a dark, dense area of thick-walled cells; 'Phloem' points to a lighter, more uniform area; and 'xylem' points to a large, open vessel structure.	(3)

Question Number	Answer	Mark
1(a)(ii)	The only correct answer is D three <i>A is not correct because phloem transport water and organic solutes and are connected to other cells via plasmodesmata and moves substances by translocation</i> <i>B is not correct because phloem transport water and organic solutes and are connected to other cells via plasmodesmata and moves substances by translocation</i> <i>C is not correct because phloem transport water and organic solutes and are connected to other cells via plasmodesmata and moves substances by translocation</i>	(1)

Question Number	Answer	Additional guidance	Mark
1(b)(i)	An answer that includes the following points: - cellulose (1) {peptidoglycan / murein} (1)	mark first answer on each line accept polysaccharide / hemicellulose / lignin / (calcium) pectate Accept small {proteins / peptides}	(2)

Question Number	Answer	Additional guidance	Mark
1(b)(ii)	An explanation that includes three of the following points: - cellulose (microfibrils) {in layers / in a mesh / at different angles / embedded in pectin} (1) (cellulose / microfibrils / hemicellulose / middle lamella) for {reduced flexibility / strength} (1) - shape of lignin (1) (lignin/ secondary thickening / secondary walls) for {strength / related to lateral movement of water} (1)	accept cellulose (molecules) bonded together by hydrogen bonds accept support / rigidity / stability e.g. helices ignore lignin unqualified accept support / rigidity / stability / reduced flexibility ignore impermeable to water	(3)
