

- 40** Monoclonal antibodies are used to test for the presence of the hormone HCG in the urine of a human female during early pregnancy.

Which statements describe how the monoclonal antibodies used in this test are produced?

- 1 HCG is injected into a mouse, and plasma cells in the mouse produce antibodies specific to HCG.
- 2 Antibodies are extracted from the mouse and then fused with cancer cells to produce hybridoma cells.
- 3 Single hybridoma cells are cultured and they divide by mitosis to produce a clone of hybridoma cells.
