

- 15** The table shows the results from an investigation into the effect of temperature on an enzyme-catalysed reaction. All other variables were standardised.

temperature / °C	rate of reaction / arbitrary units
10	3
20	7
30	16
40	33
50	32
60	14

What is the correct conclusion?

- A** 40 °C was the optimum temperature.
- B** The data for 50 °C was anomalous.
- C** The optimum temperature was between 30 °C and 50 °C.
- D** All the enzymes denatured at 60 °C.
