

4(a)	any three from: 1 repeat treatment causes, bigger / more rapid, immune response ; 2 (so) target cells (expressing new protein) short-lived / AW ; 3 decrease in (trans)gene expression on re-administration ; 4 AVP ; e.g. <i>ref. to</i> antibody binding / antibodies attract phagocytes	3
4(b)	any four from: <i>naked DNA</i> 1 has to be injected into target cell / lack of organ-specific delivery ; 2 low efficiency of cellular uptake ; 3 rapidly broken down ; <i>viruses</i> 4 small packaging capacity / only small amount of DNA can be carried ; 5 low probability of integration (into host genome) ; 6 cause mutations in host DNA / (gene) insertion disrupts gene function / insertional mutagenesis ; <i>liposomes</i> 7 low ability to, add DNA / genes, into target cells (genome) / low transduction efficiency ;	4
4(c)(i)	1 red blood cells had 'self' antigens ; 2 not recognised as foreign ;	2
4(c)(ii)	(red blood cell) has no nucleus so no, DNA / transcription / translation, of targeting proteins ; ora	1
