

- 8 The diagram shows naturally occurring D-glucose and a form of glucose that can be synthesised in the laboratory, known as L-glucose.

D-glucose

L-glucose

The enzyme glucose oxidase catalyses the oxidation of D-glucose. The enzyme **cannot** catalyse the oxidation of L-glucose.

Which statement about L-glucose explains this?

- A L-glucose does **not** fit into the active site of glucose oxidase.
- B L-glucose has a different structural formula to D-glucose.
- C L-glucose is a synthetic sugar.
- D L-glucose is the mirror image of D-glucose.
