

Question	Marking Guidance	Mark	Comments
06.1	1. (Overall) outward pressure of 3.2 kPa; 2. Forces small molecules out of capillary;	2	
06.2	Loss of water/loss of fluid/friction (against capillary lining);	1	
06.3	1. High blood pressure = high hydrostatic pressure; 2. Increases outward pressure from (arterial) end of capillary/reduces inward pressure at (venule) end of capillary; 3. (So) more tissue fluid formed /less tissue fluid is reabsorbed;	3	3. Allow lymph system not able to drain tissues fast enough
06.4	1. Water has left the capillary; 2. Proteins (in blood) too large to leave capillary; 3. Increasing/giving higher concentration of blood proteins (and thus wp);	3
