

- 4** The kidneys perform important roles in filtering the blood and maintaining fluid levels in the body.

Each kidney contains up to a million functioning units called nephrons.

Each nephron consists of a filtering unit of tiny blood vessels called a glomerulus that is attached to a tubule.

(a) The diagram shows part of a human kidney.

- (i) Draw an arrow on the diagram to show the location of a single Bowman's capsule (renal capsule).

(1)

(c) Describe how ADH is involved in the control of the water potential of the blood.
