

40 A vaccine is used to give immunity to the virus that causes the disease influenza.

A new influenza vaccine is needed every year because the virus mutates regularly.

What is the reason for needing a new influenza vaccine every year?

- A** Memory cells become less effective as they age.
- B** The primary immune response does **not** produce enough antibodies.
- C** The secondary immune response does **not** produce enough antibodies.
- D** The virus antigens change and are **not** recognised by the immune system.
