

6(a)(i)	anaerobic conditions / no oxygen available / little oxygen available ;	1
6(a)(ii)	carbon dioxide ;	1
6(a)(iii)	dehydrogenation ; decarboxylation ;	2
6(a)(iv)	red blood cell / erythrocyte ; (so) no mitochondria ;	2
6(a)(v)	substrate-linked phosphorylation ;	1
6(b)(i)	volume of carbon dioxide produced ÷ volume of oxygen consumed ; per unit time ;	2
6(b)(ii)	lipids / fatty acids, metabolised (not having fed) ; sugar / carbohydrates, metabolised (after feeding) ;	2

Question	Answer	Marks
6(b)(iii)	$\frac{95}{32}$ or $95 \div 32$; 2.97 ;	2
6(b)(iv)	any two from: 1 substrate immediately available to muscle cells ; 2 no need to break down, glycogen / energy stores ; 3 glycogen still available as substrate between feeds ; 4 AVP ; e.g. cannot carry stores as need to be light to fly	2
