

- 20** Four nucleotides, **A**, **B**, **C** and **D**, each consist of three phosphate groups, a nitrogenous base and a pentose sugar. Characteristics of the base and sugar components before they are joined to form each nucleotide are shown in the table.

Which nucleotide could pair with an adenine base during DNA replication?

	ring structure of nitrogenous base	ratio of carbon to oxygen atoms in pentose sugar
A	double	1 : 1
B	double	5 : 4
C	single	1 : 1
D	single	5 : 4
