

1(a)	A – Schwann cell / myelin sheath ; B – axon / axoplasm / cytoplasm ;	2
1(b)	1 action potential / impulse, 'jumps' from node to node ; 2 local circuits, set up between nodes / longer ; A local currents 3 fast / increases speed (of transmission of impulse) ;	3
1(c)	<i>any five from:</i> 1 no calcium ions enter (the presynaptic knob) ; 2 (so) vesicles do not, move towards / fuse with, <u>presynaptic membrane</u> ; 3 no, exocytosis / release, of ACh ; R exocytosis of vesicles 4 ACh does not <u>diffuse</u> across (synaptic) cleft ; 5 no binding with receptor (protein) on <u>postsynaptic membrane</u> ; 6 sodium (ion) channels do not open ; 7 sodium ions do not enter (postsynaptic) <u>neurone</u> ; 8 no depolarisation (of postsynaptic membrane) ;	5
