

- 28** Which statement about sucrose loading into companion cells and then into the phloem sieve tube element is **not** correct?
- A** Hydrogen ions and sucrose molecules move into the companion cells using a carrier protein.
 - B** Hydrogen ions are pumped out of the companion cells by active transport.
 - C** Sucrose molecules are carried into the companion cells down the concentration gradient for sucrose.
 - D** Sucrose molecules move from a companion cell into the sieve tubes of the phloem through plasmodesmata.
