

Question	Marking Guidance	Mark	Comments
06.1	F = Filament and G = (Secondary) lamella(e)/(gill) plate;	1	Reject gill arch Accept <u>primary</u> lamella(e) for F
06.2	1. Water and <u>blood</u> flow in opposite directions; 2. Maintains diffusion/concentration gradient of oxygen OR Oxygen concentration always higher (in water); 3. (Diffusion) along length of lamellae/filament/gill/capillary;	3	2. Accept: converse for carbon dioxide 2. Accept: equilibrium not reached 3. Accept: all/whole of lamellae/filament/gill/capillary
06.3	1. (Oxygen) decreases as depth increases to 750m, then (with further depth it) increases; 2. (<i>A. fimbria</i>) present in water with low/lower oxygen (concentration) OR (<i>A. fimbria</i>) present in wide range of oxygen (concentrations);	2	1. Accept for 750m any value in range (730m – 790m). 2. Accept converse e.g. <i>A. fimbria</i> not present in water with high oxygen (concentration).
06.4	1. (Generally) lower the oxygen concentration, the higher ratio/(gill) surface area to body mass; 2. Supplies (enough) oxygen for respiration;	2
