

- 32** The graph shows the oxygen dissociation curves for haemoglobin in animals that live at high altitude and animals that live at low altitude.

What explains the oxygen dissociation curve at **high** altitude?

- A** Haemoglobin has a higher affinity for oxygen.
- B** Haemoglobin releases oxygen more readily.
- C** The change in partial pressure of carbon dioxide causes a Bohr effect.
- D** The decrease in percentage of carbon dioxide causes the curve to shift to the left.
