

6(a)(i)	<i>any two from:</i> 1 (antigen-binding site / variable region) has a shape that is <u>complementary</u> to antigen ; A tertiary / quaternary, structure 2 (antigen-binding site / variable region has) specific, sequence(s) of amino acids / primary structure(s) ; 3 <i>idea that</i> different amino acids have different, R-groups / side chains, so give different, tertiary structures / shapes (for binding to antigens) ; 4 AVP ; e.g. correct <i>ref. to</i> epitope(s)	2
6(a)(ii)	<i>idea that</i> allows flexibility for binding (to antigens) ; A at different angles for flexibility / allows variable region(s) to move	1
6(a)(iii)	<i>any one from:</i> <i>idea that</i> easier for macrophage to engulf, antibodies that have bound antigens / antibody-antigen complexes ; facilitates / AW, destruction of pathogens 'marked' by antibodies ; A <i>ref. to</i> opsonisation I stimulates phagocytosis of the pathogen, unqualified	1
6(b)	<i>any two from:</i> 1 removal of introns (from primary transcript) ; 2 (after removal of introns) exons, are joined together, in different, sequences / combination(s) ; A alternative splicing 3 not all the exons are used (in making the polypeptides) ; I capping and poly-A tails	2
