

03.2

Mitochondrial respiratory capacity is a measure of maximum ATP production in a mitochondrion. Scientists investigated the effect of a resistance exercise training (RET) programme on the respiratory capacity of mitochondria in skeletal muscle tissue. RET develops muscle strength.

The scientists:

- took samples of muscle tissue from 11 young males before and after a 12-week RET programme
- recorded the respiratory capacity of the mitochondria in the samples of muscle tissue.

Figure 3 shows some of the scientists' results.

The error bars represent ± 2 standard deviations from the mean, which includes over 95% of the data.
