

2(a)	any two from: anything within range 0.6 to 0.8 ; $\mu\text{mol dm}^{-3} \text{ min}^{-1}$ / $\mu\text{mol per dm}^3 \text{ per min}$; A $\mu\text{mol per dm}^3 / \text{min}$ or $\mu\text{mol dm}^{-3} / \text{min}$	2
2(b)(i)	ignore any explanation any two from: 1 initial rate will be, lower / slower ; 2 takes longer to reach the, plateau / end concentration / $10 \mu\text{mol dm}^{-3}$; A longer to complete the reaction / maximum concentration 3 <i>idea that</i> the final / end, concentration of product will be, the same / $10 \mu\text{mol dm}^{-3}$; I refs to the shape of the graph	2
2(b)(ii)	ignore any explanation any two from: 1 initial rate will be, higher / faster ; 2 shorter time to reach, / plateau / end concentration / $10 \mu\text{mol dm}^{-3}$; A shorter time to complete the reaction / maximum concentration 3 <i>idea that</i> the final / end, concentration of product will be, the same / $10 \mu\text{mol dm}^{-3}$; I ref. to the shape of the graph	2

Question	Answer	Marks
2(c)	any two from: 1 allows a (valid) comparison of the, activities / AW, of the enzymes ; 2 initial rate is the fastest rate ; 3 <i>idea that</i> if rate is calculated over a longer period of time than the linear part of the curve the rate will vary ; 4 not limited by substrate concentration / substrate is in excess ; A 'no limiting factors' if substrate not mentioned 5 not influenced by (increase in concentration of) product ;	2
