

- 34** A shortage of protein in the diet of children can lead to a disease that causes excess tissue fluid to build up in the abdomen.

What explains why a build-up of excess tissue fluid can occur in this disease?

- A** A shortage of plasma proteins decreases blood water potential; less tissue fluid returns to the blood.
- B** A shortage of plasma proteins increases blood water potential; less tissue fluid returns to the blood.
- C** A shortage of protein in the diet causes weak cardiac muscle, reducing hydrostatic pressure.
- D** A shortage of protein in the tissue fluid decreases its water potential; more water leaves the blood.
