

Question	Marking Guidance	Mark	Comments
09.1	All the <u>alleles</u> in a population;	1	Accept: The number of alleles in a population. Note: All or number of <u>alleles</u> in a species on its own is not enough on its own.
09.2	- Occurs in the same habitat/environment/population; - Mutation/s cause different flowering times; - Reproductive separation/isolation OR No gene flow OR Gene pools remain separate; - Different <u>allele/s</u> passed on/selected OR Change in frequency of <u>allele/s</u>; <u>Disruptive</u> (natural) selection; - Eventually different species cannot (inter)breed to produce fertile offspring;	5 max	- Accept: are not geographically isolated /separated. - Accept: same place - Accept: no interbreeding but must be a separate idea from mark point 6 which relates to definition of a species. Note: Answers relating only to allopatric speciation = 3 max, mark points 3, 4 and 6.
