

- 31** Why does the red blood cell count increase in humans as they start living at high altitude?
- A** to allow more carbon dioxide to be excreted by the lungs, preventing a fall in blood pH
 - B** to allow more oxygen to be taken up by the haemoglobin as the partial pressure of oxygen is lower
 - C** to allow more oxygen to be taken up by the lungs as there is a lower percentage of oxygen in the air
 - D** to allow more oxygen to be transported as the affinity of haemoglobin for oxygen is lowered
