

- 15** A student investigated the effect of substrate concentration on the rate of an enzyme-catalysed reaction. A graph was plotted to show the relationship between these two variables. The student was asked to take readings from the graph that could be used to determine the Michaelis–Menten constant, K_m , for this enzyme.

J, K, L and M show points read from the graphs which the student could use to determine the value of K_m .

Which two readings must the student use to determine the value of K_m ?

- A** J and K **B** J and M **C** K and L **D** L and M
