

29 Which combination of changes for loading of sucrose into the phloem by companion cells is correct?

- A** The water potential inside companion cells is increased, because protons are actively transported from the companion cell cytoplasm into the cell wall.
- B** The water potential inside the companion cell is increased, because protons and sucrose are co-transported into the companion cell cytoplasm from the cell wall.
- C** The water potential inside the companion cells is decreased, because protons are actively transported from the companion cell cytoplasm into the cell wall.
- D** The water potential inside the companion cells is decreased, because protons and sucrose are co-transported into the companion cell cytoplasm from the cell wall.
