

Lemurs are small mammals. Lemurs live in trees and feed on leaves and fruit. Scientists used a computer program to predict the expected distribution of two species of lemur, *Eulemur rufus* and *Eulemur rufifrons*, on the island of Madagascar. These predictions were based on the environmental needs of each species. Then, the scientists determined the actual distribution of these two species of lemur on the island of Madagascar.

Figure 2 shows the scientists' results.

The scientists used the mark-release-recapture method to determine the number of lemurs in one area of forest. They captured, marked and released a first sample of 30 lemurs. A week later, they captured a second sample of 25 lemurs from the same area of forest. The scientists calculated that there were 250 lemurs in that area of forest.

0 5 . 3

Suggest **one** precaution needed when marking the lemurs to make sure the estimate of the number of lemurs is valid.

[1 mark]

0 5 . 4

Using the information provided, calculate how many lemurs in the second sample were marked.
