

Question	Marking Guidance	Mark	Comments
05	1. Depolarisation of presynaptic <u>membrane</u>; 2. Calcium channels open and calcium <u>ions</u> enter (synaptic knob); 3 (Calcium ions cause) synaptic vesicles move to/fuse with presynaptic membrane and release acetylcholine/neurotransmitter; 4 Acetylcholine/neurotransmitter <u>diffuses</u> across (synaptic cleft); 5. (Acetylcholine attaches) to <u>receptors</u> on the postsynaptic <u>membrane</u>; 6. Sodium <u>ions</u> enter (postsynaptic neurone) leading to depolarisation;	5 max	1. Accept action potential for depolarisation. 2. Accept Ca^{2+}. 3 and 4. Accept abbreviations for acetylcholine as term is in the question. 6. Accept Na^+. 6. Accept 'action potential' or 'generator potential' for depolarisation.
