

- 1 The eyepiece graticule for a light microscope at $\times 100$ magnification was calibrated using a stage micrometer scale, as shown in the diagram.

Each small division on the stage micrometer scale measured exactly 0.01 mm.

A single-celled organism was viewed with the light microscope at $\times 100$ magnification. The length of the organism measured 47 units on the eyepiece graticule.

What is the actual length of the organism?

- A $1.6 \times 10^{-1} \mu\text{m}$
- B $2.9 \times 10^{-1} \mu\text{m}$
- C $1.6 \times 10^2 \mu\text{m}$
- D $2.9 \times 10^2 \mu\text{m}$
