

- 18** The jellyfish, *Turritopsis dohrnii*, is described as being immortal. If *T. dohrnii* is not eaten by predators or diseased, it seems to be able to live forever. There is no way to determine the biological age of a *T. dohrnii* individual.

Which feature of the cells in *T. dohrnii* could explain these observations?

- A** very long G phases in the cell cycle
- B** a very short S phase in the cell cycle
- C** an ability to restore telomeres to their original length
- D** fewer chromosomes than other eukaryotic organisms
