

- 4 Four students were asked to match the function with the appearance of some cell structures in an animal cell.

The functions were listed by a number.

- 1 organises microtubules to produce the spindle during cell division
- 2 synthesis of polypeptides
- 3 packaging of hydrolytic enzymes that will remain in the cell

The appearances were listed by a letter.

- V membranes which surround an enclosed inner cavity
- W non-membrane bound, spherical structures
- X a double membrane with many pores
- Y non-membrane bound, cylindrical structures
- Z membrane-bound sacs, arranged as a flattened stack

Which student correctly matched the numbered function with the appearance of the cell structure?

	1	2	3
A	W	X	Y
B	W	Z	W
C	Y	W	Z
D	Y	Z	Z
