

- 19** Equal sized potato pieces were placed into a test-tube and covered with a sucrose solution. The test tube was left for 30 minutes. All other variables were controlled.

After 30 minutes, the potato piece had not changed in size.

What can be concluded from this result?

- A** The concentration of sucrose is the same in the potato and in the solution and there is no more movement of water into or out of the potato.
- B** The concentration of sucrose is the same in the potato and in the solution and there is no net movement of water into the potato.
- C** The water potential is the same in the potato and in the sucrose solution and there is no more movement of water into or out of the potato.
- D** The water potential is the same in the potato and in the sucrose solution and there is no net movement of water into or out of the potato.
