

3(a)	<i>independent variable:</i> vaccinated or not vaccinated (against <i>Rotavirus</i>) ; <i>dependent variable:</i> number of children with (type 1) diabetes (per 100 000 population in Australia) ;	2
3(b)(i)	1 number of children (aged from 0 to 4 years) with (type 1) diabetes decreased, after the introduction of the vaccine (against rotavirus) ; 2 number of children (aged from 0 to 4 years) with (type 1) diabetes increased (slowly) from, 2000 to 2007 / 2008 to 2015 ;	2
3(b)(ii)	any three from: 1 <i>idea that</i> (mean) number of children aged from 0 to 4 years with (type 1) diabetes (per 100 000 population) is lower after introduction of vaccine ; 2 <i>idea that</i>, (95%) confidence intervals / (95%) CI / error bars (for before and after introduction of vaccine), in children aged from 0 to 4 years (before and after introduction of vaccine) do not overlap therefore number of children with (type 1) diabetes is significantly different (before and after introduction of vaccine) ; 3 10 to 14 year olds act as a control group (because they are not vaccinated against <i>Rotavirus</i>) or 10 to 14 year olds are unvaccinated (before and after introduction of vaccine) ; 4 <i>idea that</i>, (95%) confidence intervals / (95%) CI / error bars (for before and after introduction of vaccine), in children aged from 10 to 14 years (before and after introduction of vaccine) overlap, therefore number of (unvaccinated) children with (type 1) diabetes is not significantly different (before and after introduction of vaccine) ;	3
