

- 33** The pumping action of the heart creates hydrostatic pressure in the blood. The table shows the hydrostatic pressure in a blood capillary.

	arteriole end of capillary / KPa	venule end of capillary / KPa
hydrostatic pressure in blood	4.2	1.7

About 90% of the tissue fluid which surrounds a capillary is returned to the blood at the venule end.

How is this achieved?

- A** The capillary wall is more permeable at the arteriole end than the venule end.
- B** The hydrostatic pressure in tissue fluid is higher than in blood.
- C** There is a higher concentration of dissolved solutes in tissue fluid than in blood.
- D** There is osmotic movement of water from the tissue fluid into the blood.
